Why QA is critical Even at level 1 Maturity :-

Quality Assurance (QA) is very important at level 1 maturity because processes are not well defined at this stage. At this level, software development is usually unorganized and depends on individual efforts. QA helps in identifying errors early and improves quality of product. It ensures that basic standards are followed even if proper processes are not established. QA also reduces risk of system failure and improves reliability. By applying QA, teams can detect bugs and fix them before delivery. It helps in saving time and cost in long run. QA also increases customer satisfaction by delivering better software. Therefore, QA plays a critical role even at the initial stage of maturity.
